ESTIMATION THE SPECIFIC GRAVITY OF NATURAL RESOURCES WHITHIN THE
STRUCTURE OF
THE
NATURAL RESOURCE POTENTIAL THE TERRITORY
ON
THE EXAMPLE OF VURKHOV
YNA
AND PUTIL ADMINISTRATIVE DISTRICTS

Goal. The purpose of the article is to find such an approach to the calculation of the component structure of the integrated NRP territory, which will give real indications on which areas of nature use are promising for development within specific territories.

Method. The research is based on the results of calculating the structure of the NRP of Verkhovyna and Putil districts, which was received by V. Rudenko. Particularly detailed analysis was subjected to the share in the integral potential of both areas of water resources. It is established that the potential of water resources, which according to V. Rudenko is more than 50%, can be used no more than by 0.1. Therefore, it was decided to combine cost estimation of resources with the bind-index approach.

Results. On the basis of the calculations made a conclusion about the necessity of necessarily taking into account the need for each specific resource of the territory. The resulting result, taking into account the demand for the resource, has been called the productive natural resource potential (PNRP). Under this concept, it is proposed to understand the part of the total productivity of the natural resources of the territory to which there is a potential demand and at present, these resources could actually be used as means of production or consumption. Having obtained a completely realistic component structure of the nature-resource potential of the territory in the form of the Eastern Partnership, the influence of some external factors limiting development at the present stage was taken into account in order to determine the priority directions of the use of nature within the studied territory.

Scientific novelty.

The scientific novelty of the article lies in the fact that the concept of productive natural resource potential (PNRP) and the mechanism for its calculation have been introduced. This, in turn, allowed us to obtain such a structure of NRP, which can be considered as an optimal structure of nature use for a specific territory.

Practical significance.

The practical significance of the results obtained is that today we can use the received calculations to optimize the use of nature in the Verhovinsky and Putil'sky administrative regions. The applied approach to the recalculation of the component structure of the PNRP and the location of certain types of resources can be applied to other specific territories.

Key words:

natural resource potential, productive natural resource potential, component structure of natural resource potential.
